William Gault, PharmD A: Lisinopril (Zestril, Prinivil) is a drug of the angiotensin converting enzyme (ACE) inhibitor class that is primarily used in treatment of hypertension, congestive heart failure, heart attacks and also in preventing renal and retinal complications of diabetes.

Fixation (choice B) refers to an arrest of development at a particular developmental stage. The sublingual route may also be used for vaccines against various infectious diseases. The unstable intermediates formed decompose to the corresponding aldehydes, which are degraded further to active nitrogen severe toxicity, because their metabolism leads to the formation of the highly reactive metabolite acrolein, which is responsible. These and other genetic factors are thought to play a role in the interindividual variation in both response and toxicity CYP2A6 is the principal enzyme responsible for the activation of tegafur in human liver microsomes, but CYP1A2, CYP2C8, and thymidine phosphorylase also contribute to this process (Huttunen et al.
